

Introducing - usion

FUSION is an **AI**-powered Investment Committee consisting of a swarm of **5 specialized AI agents** that autonomously audit startup pitch decks, conduct real-time inter-agent **debates**, and deliver a final INVEST / PASS / CONDITIONAL verdict with a weighted risk scorecard -- all in under 5 minutes.

**Managing Partner** Command
Committee Chair & Managing Partner
Chairs the investment committee, dispatches deals, and synthesizes final verdicts.
DUE DILIGENCE CHECKLIST

**Financial Partner** Analysis
Forensic Accountant & Financial Analyst
Stress-tests the revenue model, burn rate, and unit economics.
DUE DILIGENCE CHECKLIST

**Legal Partner** Analysis
M&A Legal Counsel
Audits contracts, IP ownership, regulatory compliance, and active lawsuits.
DUE DILIGENCE CHECKLIST

**Technical Partner** Analysis
CTO Advisor & Security Auditor
Audits codebase, software lifecycles, and security posture.
DUE DILIGENCE CHECKLIST

**Market Partner** Analysis
Market Research Director
Validates market size (TAM), competitive landscape, and sector timing.
DUE DILIGENCE CHECKLIST

FUSION SWARM OPERATING SYSTEM LIVE

Autonomous VC Due Diligence Swarm

Admit five specialized AI partner agents into parallel roundtable deliberation. Driven by a deterministic calculations engine to ground financial math, connected dynamically via the Band AI WebSocket event bus, and queryable using standard Model Context Protocol (MCP) servers.

FUSION & BAND AI COLLABORATION

- * **WebSocket-Powered Boardroom:** All 5 specialist agents interact via dedicated, real-time Band AI communication rooms.
- * **Dynamic Agent Recruitment:** The Managing Partner uses the Band SDK (thenvoi) to discover and recruit domain experts into the deal room on the fly.
- * **Cross-Domain @Mentions:** Agents tag each other (e.g., @legal-partner) to raise flags, share evidence, and debate conflicting data points.
- * **Real-Time Boardroom Debates:** Instead of static pipeline steps, agents use Band rooms to challenge each other's assessments and reach a unified, high-conviction investment decision.

Problem & Solution

The Main Pain Points:

1. Time: Traditional venture capital due diligence can take weeks to months.
2. Cost: Professional fees for each deal range from \$100,000 to \$500,000.
3. Failure Rate: Companies like WeWork, Theranos, and FTX all passed human diligence before experiencing catastrophic collapses.
4. The Silo Problem: Specialists often work in silos, with lawyers not communicating with engineers, financial analysts unaware of pending lawsuits, and conflicts across domains not being reconciled until it's too late.

The Core Narrative:

“The problem isn’t a lack of intelligent individuals. It’s a coordination failure.”

How FUSION Solves the Problem:

1. Investigate Independently: Four partner agents conduct deep-dive audits in parallel (Financial, Legal, Technical, Market).
2. Coordinate in Real-Time: Partners communicate via Band AI using @mentions, sharing findings and flagging risks.
3. Debate Findings: When partners disagree, the Managing Partner runs a committee debate to resolve conflicts.
4. Deliver a Unified Verdict: Output is a single, weighted risk scorecard with an INVEST / PASS / CONDITIONAL decision and confidence percentage.
5. Professional Output: A publication-grade PDF report is generated automatically.

MCP Server Integration

MCP Of Fusion

- Makes the investment committee available as AI tools for external clients.
- Runs the complete committee workflow through a single interface.
- Retrieves past deals and committee decisions from shared memory.
- Searches for similar investment cases to support decision-making.
- Learns new risk patterns and evaluation rules over time.

Access Modes

1. Remote URL: Access the MCP server using `http://localhost:8000/mcp` without any installation required.
2. Local Stdio: Run the server locally using `python mcp_server.py` for integration with Claude Desktop and Claude Code.

Integrations
Connect the FUSION investment committee to your AI assistant in seconds.

Connect FUSION to your AI • Live · 5 tools
Use the full investment committee inside Claude, Cursor, or any AI tool — no coding.

YOUR FUSION LINK

`http://localhost:8000/mcp` Copy link

Paste a link Claude Code Config file Local (advanced)

- 1 Open **your** AI tool (Claude, Cursor, ...) and find "Add connector", "Add custom MCP", or "Integrations".
- 2 Paste the FUSION link above into the URL box and confirm.
- 3 Ask it: "Use FUSION to evaluate this startup." — that's it. ✓

WHAT YOUR AI CAN NOW DO

✓ chat_with_managing_partner Talk to the Managing Partner in plain English. Submitting a deal/pitch activates the committee.	✓ get_deal_record Retrieve a past investment target timeline, decision, and risk scorecard data from the shared memory graph.
✓ get_boardroom_verdict Get the investment committee's final verdict for a startup deal.	✓ query_deal_vault Query collective memory for similar past evaluations by sector or risk pattern.
✓ learn_risk_pattern Teach the committee a due diligence checklist or risk pattern.	

Agent **Memory** Architecture

- Each AI agent maintains its own role-specific memory, enabling specialized expertise.
- Stores past interactions, analyses, and decisions for future reference.
- Preserves context across sessions, ensuring consistent and informed responses.
- Continuously learns from new experiences and updates its knowledge base.
- Unlike traditional AI systems, agents leverage both individual and shared memory to support collaborative decision-making.

Figure: AI agents utilize the Graphify framework for persistent memory storage, retrieval, and knowledge management.

Tech & Architecture

- **Stateful Multi-Agent Swarm (LangGraph):** Compiles 5 to 9 specialized ReAct agents (financial, legal, technical, market, and managing) executing parallel reasoning loops and custom domain tools.
- **Band Room WebSocket Coordination:** Connects agents across isolated rooms using native @mentions and allows the incident commander to dynamically discover and recruit specialists via thenvoi_lookup_peers.
- **Shared Knowledge Graph (Graphify):** Caches past evaluations, security recipes, and CVE lookup data to continuously optimize agent context and recall historical solutions.
- **Real-time Event Bus:** FastAPI WebSocket bridge that streams agent thoughts, warnings, and task completions to the frontend dashboard.
- **Interactive Next.js 14 Dashboard:** Visual UI using React Flow to map real-time swarm debate nodes, logs, and live interactive chat rooms.

Featherless  |  **AI/ML API**

Featherless and AI/ML api integration

- **AIML API Orchestration:** Primary endpoint routing orchestrator workflows to advanced models (Claude 3.5 Sonnet).
- **Featherless AI Specialization:** Runs uncensored open-source security models (Mistral-7B) for malware analysis.
- **Resilient Fallback Chain:** Custom router dynamically cascades requests (AIML API → Groq → Featherless → Gemini) to bypass rate limits.
- **Zero Cold-Starts & Unified Integration:** Ensures ultra-low latency execution and simple OpenAI-compatible SDK setup.

About us

Baljot Singh (Cofounder & CTO)

I am a Bachelor of Computer Applications (BCA) student. In this AI era, I have advanced into agentic AI and AI automations — and I consider myself both an AI journalist and a developer.

We built FUSION to address the research complexities companies face when investing in or acquiring another company.

Due diligence is slow, expensive, and siloed — specialists work in separate lanes and rarely see each other's findings. FUSION brings five specialist AI agents into one boardroom, investigating a startup simultaneously across financial, legal, technical, and market dimensions — then delivering a single, evidence-backed verdict.

GitHub: <https://github.com/baljotchohan>

Damandeep Singh (Founder & CEO)

I am currently pursuing my second year in BE AI&ML with a passion for building interfaces that make complex systems feel simple.

We built FUSION because the problem was not just slow due diligence — it was that no one had ever put all the right experts in the same room at the same time.

With Band as our collaboration layer, five AI agents now coordinate in real time through shared chat rooms, @mentioning each other, passing findings, and debating conflicts — exactly the way a real investment committee should work, but faster and without the politics.

My role was bringing that boardroom to life on screen—the real-time agent activity, the verdict cards, the risk scorecards —so investors and founders can watch the committee think.
